Oakvale Data Lakehouse

This project implements a complete data lakehouse architecture on AWS for Oakvale. The system extracts movie data, processes it through a three-layer architecture (bronze, silver, gold), and makes it available for analytics.

Architecture Overview

The data lakehouse architecture consists of:

- 1. **Data Generation**: Lambda function generates fake movie data using Python's Faker library
- 2. Storage: Three S3 buckets for raw data, lakehouse data (in Delta format), and Glue scripts
- 3. **Processing**: AWS Glue jobs for ETL processing through three layers:
 - o Bronze: Raw data from the source
 - Silver: Cleaned and transformed data
 - o Gold: Aggregated data for analytics

Components

S3 Buckets

- oakvale-raw-data: Stores raw JSON data from the Lambda function
- oakvale-lakehouse: Stores processed data in Delta Lake format
- oakvale-glue-scripts: Stores AWS Glue ETL scripts

Glue Databases

- oakvale bronze: Raw data in Delta format
- oakvale silver: Cleaned and normalized data
- oakvale_gold: Aggregated data for analytics

ETL Process

- 1. Lambda Function: Generates movie data and stores it in the raw bucket
- 2. Bronze Layer: Reads raw JSON data and converts it to Delta format
- 3. Silver Layer: Cleans and normalizes the data (fixes data types, normalizes categories)
- 4. **Gold Layer**: Creates aggregated metrics (by genre, studio, release year)

Project Structure

```
├── variables.tf # Terraform variables
└── glue_jobs.tf # Glue jobs configuration
```

Deployment

- 1. Ensure you have AWS credentials configured
- 2. Install Terraform
- 3. Create a directory for Delta jar files:

```
mkdir -p ../delta_jar
```

4. Download required Delta Lake jar files:

```
curl -L -o ../delta_jar/delta-core_2.12-2.1.0.jar
https://repo1.maven.org/maven2/io/delta/delta-core_2.12/2.1.0/delta-
core_2.12-2.1.0.jar
curl -L -o ../delta_jar/delta-storage-2.1.0.jar
https://repo1.maven.org/maven2/io/delta/delta-storage/2.1.0/delta-
storage-2.1.0.jar
```

5. Package Lambda function:

```
pip install faker boto3 -t ./lambda_package
cp extract_api_data/api_data.py ./lambda_package/
cd lambda_package && zip -r ../lambda_package.zip . && cd ..
```

6. Initialize and apply Terraform:

```
terraform init
terraform apply
```

Data Flow

- 1. Lambda function generates movie data daily and stores it in the raw bucket
- 2. Glue workflow triggers the bronze job to process raw data
- 3. Upon completion, the silver job is triggered to clean and normalize data
- 4. Finally, the gold job creates aggregated metrics for analytics

Accessing the Data

The processed data can be accessed using:

AWS Athena for SQL queries
AWS QuickSight for visualization
Any tool that supports Glue Data Catalog as a metadata store
